This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

#### Highlights

- A novel dynamic evaluation system is proposed for monitoring urban ambient air condition
- The enhanced sine cosine algorithm is proposed to tune the parameters of forecast engine.
- The fuzzy synthetic evaluation model with entropy weight is used to perform the air quality levels.
- Three real data examples are conducted to investigate the proposed monitoring system.
