This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- A new approach is proposed to decrease computational time for cyclic problems involving different time scales.
- The approach is based on the use of pre-computed space-time modes which are further collected in a dictionary.
- For a physical time belonging to the range of the dictionary, the solution can be accurately predicted.
- For a given cycle time, the solution is predicted accurately if the dictionary contains the space-time modes associated with this specific time.
