This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Evaluation of artificial neural network models for online monitoring of alkalinity in anaerobic co-digestion system

Highlights

- Software sensor method was studied for alkalinity online monitoring.
- The inputs could be monitored online and have vital relationships with alkalinity.
- pH, ORP, and EC were selected as the inputs in alkalinity prediction model.
- Optimal artificial neural network model was 3-2-1 structure with the R^2 of 0.9948.
- ORP was the most significant model factor with the highest sensitivity degree.

Abstract

Compared to pH monitoring during the anaerobic digestion process, alkalinity as an indicator could provide earlier warning for instability of digestion process, which is very important for efficient operation of biogas digesters, especially for multiple feeding substances. However, the online monitoring of alkalinity is still unavailable
