This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The social brain is dysfunctional in young people with first episode psychosis.
- Temporoparietal hypoactivation in FEP was negatively correlated with symptomatology.
- Aberrant activation was not associated with global social and occupational functioning.
- Young people with FEP may benefit from interventions that target theory of mind.
