Linking design and operation performance analysis through model calibration:
Parametric assessment on a Passive House building

Lamberto Tronchin, Massimiliano Manfren, Patrick AB. James

PII: S0360-5442(18)31797-3
DOI: 10.1016/j.energy.2018.09.037

10 **Abstract**

11 Efficient buildings are an essential component of sustainability and energy transitions,
12 which represent today a techno-economic and socio-economic problem. New paradigms
13 are emerging both for new and existing buildings (e.g. NZEBs) and passive design
14 strategies are becoming increasingly common. However, the adoption of these strategies
15 in mild climates has to be carefully evaluated to prevent overheating in intermediate
16 seasons and increasing cooling loads in summer, considering also climate change
17 scenarios. Additionally, optimistic assumptions about building technology performance
18 are often considered and the variability of occupant comfort preferences and behaviour
19 is generally neglected in the design phase. The research presented aims at verifying the
20 suitability of a simple, robust and scalable calibration approach (based on multivariate
21 linear regression) to link design and operational performance analysis transparently,
22 using a Passive House case study building. First, the original baseline design
23 configuration is compared with a larger spectrum of data generated by means of
24 parametric simulation, following a Design of Experiment (DOE) approach. After that,
25 regression models are trained first on simulation data and then progressively calibrated
26 on measured data during a three year monitoring period. The two fundamental
27 objectives are evaluating the robustness of design phase performance analysis through
28 parametric simulation (i.e. detecting potentially critical assumptions) and maintaining a
29 continuity with operation phase performance analysis (i.e. exploiting the feed-back from
30 measured data).
31

32 **Keywords:** Parametric modelling; behavioural modelling; building performance
33 simulation; Passive House; performance monitoring; multivariate regression.
34

35 **Highlights:**

- 36 • Buildings are a relevant element in sustainability transition policies.
37 • Rigorous schemes for energy efficiency are important tools for designers.
38 • Robustness of performance estimates has to be considered in design phase.
39 • Design and operational performance analysis have to be linked transparently.
40 • Automated model calibration is necessary to ensure long-term performance
41 monitoring.
