In France, baclofen has recently been authorized for its effectiveness in treating symptoms of alcohol withdrawal syndrome. As a result, the number of reports on baclofen intoxication has increased in recent years. This is a retrospective review of the medical records (clinical characteristics, management and outcome) of eight patients (5 males, 3 females, median [Q1-Q3] age: 41 [38-48] years), admitted for baclofen intoxication in our ICU from June 2013 to February 2015.

One patient was admitted for an overdose secondary to renal failure, others were admitted for self-poisoning suicide attempts. Six patients had co-ingested others toxic substances (Table 1). The mean supposed ingested dose of baclofen was 250 [170-525] mg. Upon admission, the median
