This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Knee flexion not hip extension strength is persistently reduced following hamstring strain injury  
in Australian Football athletes: Implications for Periodic Health Examinations**

**Running heading:** Isometric knee flexion strength is persistently reduced in Australian Football athletes with past-history of hamstring strain

**Original paper for:** Journal of Science and Medicine in Sport
