## ABSTRACT

Although the history of the golden spice turmeric (*Curcuma longa*) goes back thousands of years, it is only within the past century that we learned about the chemistry of its active component, curcumin. More than 6000 articles published within the past two decades have discussed the molecular basis for the antioxidant, anti-inflammatory, antibacterial, antiviral, antifungal, and anticancer activities assigned to this nutraceutical. Over sixty five clinical trials conducted on this molecules, have shed light on the role of curcumin in various chronic conditions, including autoimmune, cardiovascular, neurological, and psychological diseases, as well as diabetes and cancer. The current review provides an overview of the history, chemistry, analogs, and mechanism of action of curcumin.

## Introduction

Curcumin is the active ingredient of the dietary spice found in the rhizomes of *Curcuma longa*, a plant in the ginger family. Turmeric, a common oriental spice that gives curry powder its yellowish color, is frequently used in Asian cooking, particularly Indian, Pakistani, and Thai cooking. Turmeric has been consumed for medicinal purposes for thousands of years. Extensive research on curcumin over the past few decades has revealed the health benefits of this ingredient to the modern era; in fact, numerous published articles, audio recordings, and videos on this subject are available to the public. Some links to videos about curcumin's health benefits are summarized in Table 1.

## Isolation of curcumin

Because curcumin is insoluble in water, an organic solvent has been used for its isolation. Anderson et al. (2000) developed a technique for isolating curcumin from ground turmeric. They magnetically stirred the ground turmeric in dichloromethane and heated at reflux for 1 h. The mixture was suction-filtered, and the filtrate was concentrated in a hot-water bath maintained at 50 °C. The reddish-yellow oily residue was triturated with hexane, and the resulting solid was collected by suction filtration. Further TLC analysis (3%

methanol–97% dichloromethane) showed the presence of all three components (Anderson et al., 2000). Recently, Bagchi (2012) described extraction of curcumin from turmeric powder with the use of a solvent consisting of a mixture of ethanol and acetone. Chemical analyses have shown that turmeric contains protein (6.3%), fat (5.1%), minerals (3.5%), carbohydrates (69.4%), and moisture (13.1%). The essential oil (5.8%) obtained by steam distillation of the rhizomes contains α-phellandrene (1%), sabinene (0.6%), cineol (1%), borneol (0.5%), zingiberene (25%), and sesquiterpenes (53%); curcumin (3%–6%) is responsible for the yellow color. Now numerous biotech companies are isolating curcumin commercially, making it available to everyone. Some of these include Biotech Pharmacal Inc., Santa Cruz Biotechnology, Curcumin-Shijiazhuang Ivchuan Biotechnology Co. Ltd, Xiaoyuan Biotechnology Co., Ltd., and Anubhav Biotech Ltd.

## Discovery of curcumin

Curcumin was discovered about two centuries ago by Vogel and Pelletier, who described it as a "yellow coloring-matter" from the rhizomes of *C. longa* (turmeric) (Vogel and Pelletier, 1815). Pure curcumin was prepared in 1842 by Vogel Jr. (Vogel, 1842). The possible structure of curcumin was reported by several chemists in the subsequent
