Precise Detection of Speech Endpoints Dynamically: A Wavelet Convolution based approach

Tanmoy Roy, Tshilidzi Marwala, Snehashish Chakraverty

PII: S1007-5704(18)30223-5
DOI: [10.1016/j.cnsns.2018.07.008](https://doi.org/10.1016/j.cnsns.2018.07.008)
Reference: CNSNS 4578

To appear in: *Communications in Nonlinear Science and Numerical Simulation*

Received date: 14 April 2018
Revised date: 9 June 2018
Accepted date: 4 July 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Online detection of speech endpoints with high precision is a difficult problem.
- A unique wavelet transform based approach is proposed as a solution.
- Decomposed speech signals demonstrate interesting patterns at different frequencies.
- Information content and dynamic thresholds also contribute to the segregation rule.
- Precise removal of silence and non-speech artifact apart from process automation.
