This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

1

Highlights

- Normal hematopoiesis is regulated by a complex set of interactions between HSCs and their niches
- Mutations in stromal cells can promote dysregulated hematopoiesis in healthy HSCs
- This has profound implications for germline-associated leukemias
- Prevention and management strategies for stromal-induced leukemias may exist
