This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The relationship between fine-grained behavior and social anxiety levels is examined.
- Multimodal sensor fusion is proposed to represent fine-grained behavior.
- Individuals' behaviors with different social anxiety levels are significantly different.
- The implications of these findings for developing better interventions are discussed.
