This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- Mass-action reproduction is unsuitable for modelling gene drives in vertebrates
- The evolution of resistance threatens the viability of gene drives for pest control
- Reproductive Allee effects could assist gene drives to eradicate invasive species
- 5 • Pest species' demography must be understood to inform applied modelling efforts
