Pedagogy of discomfort

ABSTRACT

This discussion paper outlines an approach to developing and evaluating an educative programme primarily delivered by lay 'citizen trainers' in educating student nurses, and student midwives to the impact of and experience of extended and extensive civil unrest within their communities ('the Troubles'). This is drawn from experience within the Northern Ireland 'Troubles' and all of the citizen trainers were directly affected physically/psychologically. The programme was intended to both educate but primarily to help facilitate student nurses and student midwives to better understanding to experience and context and to more effective care delivery to those affected by/damaged by 'the Troubles'. Evaluation of the teaching and learning by the students was significantly positive.

Introduction & Background

This paper addresses an innovative approach to teaching and evaluation of teaching to nursing and midwifery students, addressing sensitive social and political issues arising from civil conflict within their community of N. Ireland.

'The Troubles' in Northern Ireland took place over an extended period with civil conflict particularly marked from the mid to late 1960s. The Troubles possibly resulted in the immediate death of some 3800 people with estimates in excess of 40,000 having suffered severe injury. In addition, an indeterminate number of the citizenry suffered significant and ongoing psychological and subclinical symptoms as a consequence of the extremes of civil unrest. The legacy of 'The Troubles' is further reflected in disproportionately high levels of antisocial behaviour, family dysfunction, drug and alcohol dependency within the province (Wave, 2014). WAVE, as an organisation, was formed in the early 1990s and is a cross community voluntary organisation offering care and support to anyone bereaved, suffering trauma or injury as a result of the violent civil conflict.

A significant number of patients and clients that current nursing students will be attending to in the course of their nursing and midwifery training or subsequent to qualification, may present with primary or secondary conditions associated with their experiences of the conflict. Many of the students will be drawn from social and geographical areas previously impacted by 'The Troubles'. Therefore a joint educative initiative between the School of Nursing and Midwifery at Queen's University Belfast and WAVE was established to better inform nursing and midwifery

students of the skills, knowledge and context required in working with those who have experienced trauma directly or indirectly as a result of the Northern Ireland conflict. As co-educators, WAVE delivered a core lecture (augmented by online material), which was then followed by tutorials with nursing and midwifery students. The tutorials were substantially led by those who had been involved with and experienced loss and trauma as a result of the conflict (Health Service users) and provided an opportunity to share their experience and their recollection of personal interactions with medical and nursing professionals. This approach is relatively unique in that it involves many of those directly involved with and injured by 'The Troubles' as 'citizen trainers' and clearly reflects the School's policy of progressively engaging with users and carers of nursing and midwifery services as co-educators to students.

Delivery of this teaching by WAVE forms part of the final phase of first year teaching in the Health and Wellbeing module. This module addresses the context of health; the anatomy and physiology of the body and human health (Life Sciences) but also the psychological, social, health education and public health dimensions of nursing and midwifery and the context of care.

Evaluative Aims were to evaluate the quality and clinical usefulness of teaching by the WAVE team to first year nursing students and involved piloting an innovative approach to evaluating part of the teaching module. Module evaluations are used to determine the quality of teaching and its impact as assessed by the nursing and midwifery students, with the intention to determine the standard and value of service delivery (Grant et al., 2013).

Methodologically a quantitative approach to audit and evaluation was undertaken in order to provide a breadth of understanding and insight to the student's experience and allow interpretation of the value to practice of the teaching delivery (Brown, 2014).

An evaluative audit was undertaken with first year nursing students (adult field) after completion of the module, at the end of their first year of teaching and following the completion of two placements in clinical practice. The intention was to develop an audit tool that could be utilised for evaluating modules within the nursing and midwifery teaching programme. Regard was given to the sensitivity of the issues (with the population of nursing students coming from diverse backgrounds) and how to better encourage an honest evaluation of the teaching and an individual evaluative method that might reduce the impact of peer influence. Three weeks were allowed to elapse from the delivery of teaching to the evaluation of this part of the module to better provide for qualitative reflection.

This study provides a descriptive survey of adult nursing student's perceptions of the WAVE teaching sessions following its inclusion in the Health and Wellbeing module within an undergraduate nursing programme. A convenience sample of first year adult nursing students ($n = 80$) were identified to complete a questionnaire and the evaluation was completed by 66 students ($n = 66$).

The student's opinion was investigated by means of a questionnaire and comprised seventeen questions using Likert type Scales. Questions were designed to seek the student's views on (1) the importance of inclusion of the topic on the UG curriculum, (2) the usefulness of lecture material, (3) the value of including survivors in delivery of the material, (4) the impact of the material and (5) requirements for further content (the five areas). Parahoo (2014) suggests that ease of analysis and the high degree of reliability makes questionnaires suitable for this type of research where data is being sought from a large number of individuals at one time.

In an attempt to encourage a good response rate, the questionnaire was conducted as part of the module review in the last lecture of the module during the last week of the final phase. It was a convenient time and location for potential respondents.

The questionnaire was constructed using a five point Likert type scale (ranging from "strongly agree" to "strongly disagree" and an "undecided" option, with a few yes/no answer questions). In order to facilitate such a large group, to ensure confidentiality, ease of collation of data and to reduce completion time the Personal Response System (PRS) was used.

Validity and Reliability was reflected in the design of the questionnaire in terms of both content and its construct validity (Parahoo, 2014). It was reviewed by colleagues experienced in this area of questionnaire development and piloted with previous student cohorts.

Ethically some of the nursing student population may have found the subject area covered by the WAVE sessions challenging, from their background and life or family experience. The issue of teaching to a particularly challenging area was addressed sensitively throughout, with support measures in place, and the students were under no obligation to take part in the module evaluation.

Data Analysis involved instantaneous responses. Subsequently the results were analysed using the PRS software.

Results from each of the five areas were assessed by multiple questions and there was close agreement of responses suggesting good construct validity. In response to questions seeking views on the importance of including Troubles-related teaching on the curriculum (Appendix Fig. 1) 74% of respondents agreed or strongly agreed that it was important. Eleven (13%) did not think it should be included in the curriculum.

Overall, the students rated the teaching highly, especially the open and informal approach to the sessions which they felt made their experiences real to them (91% agreed/strongly agreed); with 68–88% agreeing or strongly agreeing that the lecture material was informative and had increased their knowledge and understanding (Appendix Fig. 2). Only 12 (13%) felt the lecture material was not useful or informative.

When asked if the issues of victim's/survivors should be studied by nursing and midwifery students 74% agreed/strongly agreed; the group also firmly believed that nursing and midwifery students should be taught about "Troubles" related trauma and health related issues, with again less than 11% disagreeing or strongly disagreeing. It is unsurprising therefore that the group reported positively that the sessions

had helped them learn how people are affected by trauma/conflict (91% agreed/strongly agreed). Responses to the statement "It has made me think more about how issues of trauma may impact on my patients" yielded the most positive response (92% agreed/strongly agreed) and the students believed they were more aware of the relevance of victims and survivors health issues due to the lectures/tutorials (85% responding positively).

Overwhelmingly, the students appreciated the contribution of the citizen trainers; 88 (91%) agreed or strongly agreed that their humour, honesty and informal approach enhanced the sessions and although 2 (6%) disagreed no-one strongly disagreed with this concept (Appendix Fig. 3).

The majority of students (82%) also agreed that "This teaching will equip me for dealing with any issues regarding victims and survivors that arise in nursing or midwifery practice" (Appendix Fig. 4) however 84% agreed or strongly agreed that further information on how to provide support and where to refer patients would be useful, perhaps therefore implying that the group felt this teaching had raised their awareness of the issues but not to the point where they believed they could provide all the support their patients would or might require which is understandable.

When asked to assess the impact of the teaching sessions on their learning and practice the majority 85% agreed or strongly agreed that they were now more aware of related health issues and how this might impact on their patients. Most (82%) also agreed that the teaching would equip them for dealing with such issues in their future practice (Appendix Fig. 4). Interestingly, only 60% felt that the teaching had changed their views.

Finally, the students were asked if further information or time for the sessions was required (Appendix Fig. 5) – 64% would have liked more information on the history of 'The Troubles' and 74% would have liked more information on how to provide or refer patients for psychological support implying that the group felt this teaching had raised their awareness of the issues but not to the point where they could provide all the support their patients might require which is also understandable. Only 19% wanted more time on the subject and anecdotal evidence from the students seems to suggest that a number of them thought the sessions were "emotionally exhausting" with one student observing "It was so worthwhile and really made me think, but I didn't enjoy it, it wasn't easy listening and I couldn't have taken much more".

Discussion

In Northern Ireland there remains a tendency toward avoidance of or discomfort with discussion of sensitive issues associated with 'The Troubles': there are often strongly held emotional attachments for many in the local society or sense of fear (Jordon et al., 2007; Coulter et al., 2012).

The importance of development of Cultural Competence has been discussed by Coulter (2012) in regard to Social Work students and applies equally within nursing student training with an acknowledgement/better understanding of the lived experience of those individuals accessing health services that have been directly affected by 'The Troubles'. Whilst largely welcomed and valued by the students themselves as an area of study, the chosen pedagogy nonetheless requires careful consideration and planning of how best to facilitate deep learning whilst supporting all involved.

The advantage of what Bolter and Zembylas (2003) call 'pedagogy of discomfort' is that student learning in this emotionally charged area is enhanced as a result of the student leaving their comfort zone within the safe atmosphere of the learning environment. Testing the boundaries of personal beliefs, values and perceptions is facilitated through exploration of the experiences of victims and survivors of 'The Troubles' to enhance deep learning; at times this involved those perceived as belonging to the 'other side' in terms of cultural backgrounds in Northern Ireland.

Most of the students appreciated the value and relevance of the subject area in relation to their nursing studies and the remaining students' responses may reflect a wish to 'move on' in a post conflict society.
