

## Accepted Manuscript

Title: A generalised model of electrical energy demand from small household appliances

Author: A. Sancho-Tomás M. Sumner D. Robinson

PII: S0378-7788(16)31337-8

DOI: <http://dx.doi.org/doi:10.1016/j.enbuild.2016.10.044>

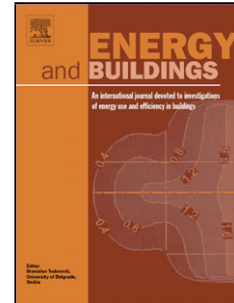

Reference: ENB 7103

To appear in: *ENB*

Received date: 13-7-2016

Revised date: 24-10-2016

Accepted date: 25-10-2016

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

# Highlights

- Proposed methodology for the modelling of the energy use of small appliances in households, categorised in four groups: audio-visual, computing, kitchen and other appliances.
- Predictions of time varying fractional power demands of aggregations of appliance.
- Comparison of seven different modelling approaches, based on two types of stochastic process: discrete time random (Markov) process (combined with clustering algorithms for matrix reduction) and continuous time random (Survival analysis) process.
- Models are validated using three types of evaluation measure: time series analysis, model accuracy and aggregated energy use.
- These validation measures suggest that the modelling of survival in discrete states performs well and is straightforward to integrate with energy simulation programs.
