This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The paper studies the effect of temporary schooling interruption on starting wages in Canada.
- The identification strategy is based on Lewbel's (2012) generated instruments approach.
- The impact of out-of-school periods on post-graduation wages differs across gender.
- This impact also depends on the activity undertaken during the interruption.
- We run a number of alternative specifications including two-stage quantile regressions.
