This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- A study on user's with intellectual disabilities preferences for image-type representation, which can be used in a digital navigation context, is presented.
- Image representation was design according to three types of representation (object (simpler to decoding), action and universe (complex to decoding)).
- Participants with intellectual disabilities preferred objects representative images for the four categories tested (music, sports, games, movies).
