This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- A parallel approach for selected inversion in genomic prediction is presented.
- The technique is used in maximizing the likelihood function of the AI-REML method.
- Strong and weak scaling tests on Cray XC40 supercomputers are performed.
- The approach is validated on real, large-scale genomic data.
