This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We show how to select directional distance functions? direction vectors optimally
- The algorithm is based on parametric nonlinear optimization methods
- Empirical illustration using the U.S. electric power plant data is provided
- Optimally selected vectors and commonly used ad hoc vectors yield different results
