This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Presents an algorithm to generate optimal quadrature points, integrating smooth piecewise polynomial functions (splines)
- Demonstrated to work on all element partitioning (knot vectors), all polynomial degrees and all continuities
- Main contribution in terms of original research: Provides a good initial guess for the quadrature points and weights
- Ties up several existing techniques into a short self-contained algorithm, source code provided: less than one page.
