Unsupervised geodesic convex combination of shape dissimilarity measures

Bilal Mokhtari, Kamal Eddine Melkemi, Dominique Michelucci, Sebti Foufou

PII: S0167-8655(17)30244-1
DOI: [10.1016/j.patrec.2017.07.012](https://doi.org/10.1016/j.patrec.2017.07.012)
Reference: PATREC 6877

To appear in: *Pattern Recognition Letters*

Received date: 31 October 2016
Revised date: 11 April 2017
Accepted date: 24 July 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Research Highlights (Required)

-

The main characteristics and contributions of the method proposed in this paper could be summarized in five items as follows:

- Formalize the combination of shape distances as a Linear Programming problem
- Distances are combined to maximize the separation power, i.e. the geodesic distance
- The geodesic distance between two shapes depends on all shapes in the database
- The method is unsupervised. No class of shapes needs to be known
- The combination outperforms the combined basic distances (even the best ones)
