This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Detection and quantification of lung cancer biomarkers by a micro-analytical device using a single metal oxide-based gas sensor.

Highlights

- A micro-fabricated lung cancer biomarkers analyzer was successfully developed.
- The selective detection of four lung cancer biomarkers was possible with a single gas sensor.
- Zeolite DaY, a highly porous solid, was used to concentrate lung cancer biomarkers.
- The micro-system exhibited high selectivity and low limit of detection.
