Title: Use of early acoustic emission to evaluate the structural condition and self-healing performance of textile reinforced cements

Authors: Michael El Kadi, Johan Blom, Jan Wastiels, Dimitrios G. Aggelis

PII: S0093-6413(16)30224-5
DOI: <http://dx.doi.org/doi:10.1016/j.mechrescom.2017.02.007>
Reference: MRC 3147

To appear in:

Received date: 3-10-2016
Revised date: 7-2-2017
Accepted date: 9-2-2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- First time that the difference between intact, cracked and self-healed TRC laminates is reported in literature.
- Simple acoustic emission parameters are indicative of the fracture mechanisms and show the transition from cracking to mixed mode.
- The differences are evident by the early activity before the mechanical load induces serious damage.
- Self-healed specimens exhibit acoustic behavior closer to the sound rather than the damaged.
