This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

Structural evolution of Au nanoparticles on substrates is simulated by kinetic MC.

Effect of temperature and metal-substrate interaction on the morphology is examined.

Activity to oxidize CO correlates with the number of top edge sites of Au particles.
