This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A systematic approach for vibrations of large deflected straight beams is presented
- General equations of free vibration of large deflected straight beams are obtained
- Effects of axial extension, shear deformation, and rotatory inertia are included
- Equations are simplified and investigated for different cases of loading conditions
- Several numerical examples are solved to show the versatility of present approach
