This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

H1: Propose two-subprocess DEA model to analyze wind turbines micrositing efficiency.

H2: The two-subprocess DEA divides the complicated system of wind turbines micrositing into two subprocesses, namely wind turbines arrangement and wind production optimization.

H3: Tobit regression model is applied to model the dependent variable obtained by DEA model to analyze assess the relationship between efficiency and environmental factors.

H4: The two-subprocess DEA model can help find out in which subprocess the low efficiency exits and help justify in which subprocess the environmental factors play significant role.
