Title: Serum peptides as putative modulators of inflammation in psoriasis

Author: Tetsuhiko Matsuura Masaaki Sato Kouhei Nagai
Toshiyuki Sato Mitsumi Arito Kazuki Omoteyama Naoya
Suematsu Kazuki Okamoto Tomohiro Kato Yoshinao Soma
Manae S. Kurokawa

PII: S0923-1811(16)30947-1
DOI: <http://dx.doi.org/doi:10.1016/j.jdermsci.2017.03.014>
Reference: DESC 3156

To appear in: *Journal of Dermatological Science*

Received date: 28-11-2016

Accepted date: 21-3-2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Patients with psoriasis possess specific serum peptide profiles.
- A fibrinogen α -derived peptide with 1462 m/z (p1462) increased in the psoriatic sera.
- p1462 increases the secretion of GRO α from dermal microvascular endothelial cells.
- A filaggrin-derived peptide with 1977 m/z (p1977) increased in the psoriatic sera.
- p1977 decreases the secretion of GRO α , IL-8, and MCP-1 from dermal endothelial cells.
