This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An optical method to determine light penetration and distribution in three different regions of the maxilla and mandible is proposed.
- Optical differences were found between the mandibular and maxillary bones.
- The maxilla attenuated more light than the mandible at all sites, leading to a shallower penetration depth

Pilot study on laser propagation in maxillary and mandibular bone: Grey level image analysis for optical measurements
