13 **ABSTRACT**

14 More than half of the world's population lives in urban areas. It is estimated that by 2030  
15 there will be 41 megacities and most of them will be located in developing countries. The  
16 megacities in India (Delhi, Mumbai, and Kolkata) collectively have >46 million  
17 inhabitants. Increasing population and prosperity results in rapid growth of the already  
18 large consumption of energy and other resources, which contributes to air pollution,  
19 among other problems. Megacity pollution outflow plumes contain high levels of criteria  
20 pollutants (e.g. Particulate matter, SO<sub>2</sub>, NO<sub>x</sub>), greenhouse gases, ozone precursors and  
21 aerosols; which can affect the atmosphere not only on a local scale but also on regional  
22 and global scales. In the current study, emissions and concentration trends of criteria and  
23 other air pollutants (polycyclic aromatic hydrocarbons, carbon monoxide and greenhouse  
24 gases) were examined in the three Indian. Further, various policies and control strategies  
25 adopted by government are also discussed to improve air quality. Decreasing trends of  
26 SO<sub>2</sub> have been observed for all three megacities due to decrease in the sulphur content in  
27 coal and diesel. Whereas, increasing trend for NO<sub>x</sub> has been found in the three megacities  
28 due to increase in number of vehicles registered and high flash point of CNG engines  
29 which leads to high NO<sub>x</sub> emission. In terms of SPM and PM<sub>10</sub>, highest emissions have  
30 been found at Kolkata whereas highest ambient concentrations at Delhi. For Mumbai and  
31 Kolkata fluctuating trends of SPM concentrations were observed between 1991 to 1998  
32 and stable afterwards till 2005, whereas for Delhi, fluctuating trend was observed for the  
33 entire study period. However, several steps have been taken to control air pollution in  
34 India but there is a need to focus on control of non-exhaust emissions including municipal  
35 solid waste and biomass burning in the megacities and surrounding areas.
