Title: Highly efficient photocatalytic bismuth oxide coatings and their antimicrobial properties under visible light irradiation

Authors: Marina Ratova, James Redfern, Joanna Verran, Peter J. Kelly

PII: S0926-3373(18)30741-0
DOI: <https://doi.org/10.1016/j.apcatb.2018.08.020>
Reference: APCATB 16920

To appear in: *Applied Catalysis B: Environmental*

Received date: 26-4-2018
Revised date: 5-7-2018
Accepted date: 6-8-2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highly efficient photocatalytic bismuth oxide coatings and their antimicrobial properties under visible light irradiation

Graphical abstract

Research paper highlights:

- Bismuth (complex) oxide and TiO_2 coatings were deposited by magnetron sputtering;
- Use of oscillating bowl enabled uniform coverage of 2mm glass beads;
- Bismuth oxide and tungstate showed high antimicrobial activity under visible light;
- Bismuth oxide prevented the adhesion of microorganisms to beads;
