This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

### Highlights

1. The injury patterns were different between adult femicide victims murdered by intimate partners and non-intimate partner offenders.
2. The rates of intracranial injury of non-intimate partner group were significantly higher than that of the intimate partner group.
3. The most common causes of death in both groups were strangulation and sharp force injury.
4. The heart injury was significantly more frequent in victims offended by intimate partners than by other assailants.
