This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## **HIGHLIGHTS**

- A new method for the evaluation of Spanish households' energy poverty is presented.
- Cooling energy needs and expenditure are incorporated in the evaluation of energy poverty for the first time.
- Indicators gathered in the method reflect climatic, building construction and socioeconomic particularities of Spanish context.
- The method represents a useful tool in the decision making processes related to policy development and dwelling energy retrofiting actions.
