This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

This paper introduces two novel echo state networks called NESN-P and NESN-MP with the following characteristics:

- ❖ A reservoir including linear internal states and readout containing units using nonlinear functions of the internal states.
- ❖ High learning capability and forecasting accuracy without significant deterioration with time.
- ❖ Fewer internal states and lower order weight matrices relative to ESN, which reduces the computational load considerably.
- ❖ A simple design, far less computation, and do not require extensive training, parameter tuning, or complex optimization.
- ❖ Significantly lower error values than those of ANFIS and ESN for different wind profiles.
