#### Abstract

The aim of this paper is to apply Thevenin's theorem to mutually coupled elements. Mutual coupling between elements exist due to proximity of elements in electric circuits. The determination of the current in a new added element to an existing circuit is usually done through Thevenin's theorem when the new element is not mutually coupled with any other element in the circuit. However, when the element is mutually coupled with other elements in the circuit, then application of Thevenin's theorem is not straightforward. Thevenin's voltages and impedances have to be modified to include the effect of mutual coupling between the new element and the existing elements of the circuit. A systematic approach to modify Thevenin's voltages and impedances is presented in this paper. Two examples are presented to demonstrate the procedure. The first example considers only single coupling while the second considers multiple coupling. In single coupling, the new element is coupled only with a single element of the circuit. In multiple coupling, the element is coupled with several elements of the circuit.

## 1. Introduction

Many electrical circuit elements have mutual coupling between them due to proximity of elements. Such coupling is due to electric field proximity as in capacitors, or magnetic field proximity as in inductors. Formation and modification of bus admittance and impedance matrices of circuits containing mutually coupled elements has been treated thoroughly [1-4]. Mutual coupling between elements of antenna arrays have been investigated by several researchers [5-12]. The effects of mutual coupling between transmission lines in power systems have been investigated in [13-19]. Thevenin's theorem has been applied widely in many fields of electrical engineering due to its simplicity. The application of Thevenin's theorem to determine the current in a new added element to a circuit is straightforward when the added element is not mutually coupled with other elements of the circuit. However, when the added element is mutually coupled with other elements of the circuit, then Thevenin's impedances and voltages have to be modified to account for the mutual effect. So many applications of electrical engineering, ranging from electronics and communications to power systems, may face problems with mutually coupled elements and hence need a systematic approach to applying Thevenin's theorem to such problems. In this paper, a systematic approach to applying Thevenin's theorem to mutually coupled elements is presented. Thevenin's voltage between the nodes of the new added element is modified by a factor depending on the mutual coupling and Thevenin's voltages of the mutually coupled element nodes. Thevenin's impedance is modified by a
factor depending on mutual coupling and Thevenin's impedances between the mutually coupled element nodes as well as between these nodes and the new added element nodes.

## 2. Mutual coupling with a single element

An external element of self-impedance $z_{s f}$ is to be connected between nodes p and q . The element is mutually coupled with an existing element connected between nodes $a$ and $b$ that has self-impedance $z_{\text {sab }}$ as shown in Fig. 1. The mutual impedance between both elements is $\mathrm{z}_{\mathrm{m}}$.

If the element is connected between the existing node p and a new node f as shown in Fig. 2, then the voltage and current relationship of both elements are
$\mathrm{V}_{\mathrm{ab}}=\mathrm{z}_{\mathrm{sab}} \mathrm{I}_{\mathrm{ab}}+\mathrm{z}_{\mathrm{m}} \mathrm{I}_{\mathrm{f}}$
$\mathrm{V}_{\mathrm{pf}}=\mathrm{z}_{\mathrm{m}} \mathrm{I}_{\mathrm{ab}}+\mathrm{z}_{\mathrm{sf}} \mathrm{I}_{\mathrm{f}}$
In matrix form
$\left[\begin{array}{c}\mathrm{V}_{\mathrm{ab}} \\ \mathrm{V}_{\mathrm{pf}}\end{array}\right]=\left[\begin{array}{cc}\mathrm{z}_{\mathrm{sab}} & \mathrm{Z}_{\mathrm{m}} \\ \mathrm{Z}_{\mathrm{m}} & \mathrm{Z}_{\mathrm{sf}}\end{array}\right] \cdot\left[\begin{array}{c}\mathrm{I}_{\mathrm{ab}} \\ \mathrm{I}_{\mathrm{f}}\end{array}\right]$
$\left[\begin{array}{c}\mathrm{I}_{\mathrm{ab}} \\ \mathrm{I}_{\mathrm{f}}\end{array}\right]=\left[\begin{array}{cc}\mathrm{z}_{\mathrm{sab}} & \mathrm{z}_{\mathrm{m}} \\ \mathrm{z}_{\mathrm{m}} & \mathrm{z}_{\mathrm{sf}}\end{array}\right]^{-1} \cdot\left[\begin{array}{c}\mathrm{V}_{\mathrm{ab}} \\ \mathrm{V}_{\mathrm{pf}}\end{array}\right]=\left[\begin{array}{cc}\mathrm{y}_{\mathrm{sab}} & \mathrm{y}_{\mathrm{m}} \\ \mathrm{y}_{\mathrm{m}} & \mathrm{y}_{\mathrm{sf}}\end{array}\right] \cdot\left[\begin{array}{c}\mathrm{V}_{\mathrm{ab}} \\ \mathrm{V}_{\mathrm{pf}}\end{array}\right]$
This yields
$\mathrm{I}_{\mathrm{f}}=\mathrm{y}_{\mathrm{sf}} \mathrm{V}_{\mathrm{pf}}+\mathrm{y}_{\mathrm{m}} \mathrm{V}_{\mathrm{ab}}$

[^0]

Fig. 1. Mutual coupling between elements.

Fig. 2. Voltage and current relationship between coupled elements.
$\mathrm{V}_{\mathrm{pf}}=\mathrm{y}_{\mathrm{sf}}^{-1}\left(\mathrm{I}_{\mathrm{f}}-\mathrm{y}_{\mathrm{m}} \mathrm{V}_{\mathrm{ab}}\right)$
With $\mathrm{I}_{\mathrm{f}}=0$, we have
$\mathrm{V}_{\mathrm{pf}}=-\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}} \mathrm{V}_{\mathrm{ab}}$
The new node voltage is
$\mathrm{V}_{\mathrm{f}}=\mathrm{V}_{\mathrm{p}}-\mathrm{V}_{\mathrm{pf}}=\mathrm{V}_{\mathrm{p}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}} \mathrm{V}_{\mathrm{ab}}$
If the circuit has node (bus) impedance matrix, $\mathrm{Z}_{\mathrm{bus}}$ of order n , and injected currents to the nodes are $I$, then we have

$$
\begin{equation*}
\mathrm{V}=\mathrm{Z}_{\mathrm{bus}} \cdot \mathrm{I} \tag{9}
\end{equation*}
$$

The voltage of node $p$ is
$\mathrm{V}_{\mathrm{p}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{Z}_{\mathrm{pi}} \mathrm{I}_{\mathrm{i}}$
where $\mathrm{z}_{\mathrm{pi}}$ are elements of the bus impedance matrix corresponding to node $p$ and $I_{i}$ is injected current at node $i$. The voltage across the element between nodes a and b is
$\mathrm{V}_{\mathrm{ab}}=\mathrm{V}_{\mathrm{a}}-\mathrm{V}_{\mathrm{b}}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{z}_{\mathrm{ai}}-\mathrm{Z}_{\mathrm{bi}}\right) \mathrm{I}_{\mathrm{i}}$
The new node voltage from (8) is
$\mathrm{V}_{\mathrm{f}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{fi}} \mathrm{I}_{\mathrm{i}}$
where
$\mathrm{z}_{\mathrm{fi}}=\mathrm{z}_{\mathrm{pi}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{ai}}-\mathrm{z}_{\mathrm{bi}}\right)$
are elements corresponding to the new node $f$ row in the bus impedance matrix. The elements of the new column corresponding to node $f$ are equal to those of its row $\left(\mathrm{z}_{\mathrm{fi}}\right)$ due to the symmetry of the bus impedance matrix. With $\mathrm{I}_{\mathrm{f}} \neq 0$
$\mathrm{V}_{\mathrm{p}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{pi}} \mathrm{I}_{\mathrm{i}}+\left(\mathrm{z}_{\mathrm{pp}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{ap}}-\mathrm{z}_{\mathrm{bp}}\right)\right) \cdot\left(-\mathrm{I}_{\mathrm{f}}\right)$
and from (6), $\mathrm{V}_{\mathrm{f}}$ is
$\mathrm{V}_{\mathrm{f}}=\mathrm{V}_{\mathrm{p}}-\mathrm{V}_{\mathrm{pf}}=\mathrm{V}_{\mathrm{p}}+y_{s f}^{-1} y_{m} \mathrm{~V}_{\mathrm{ab}}+y_{s f}^{-1}\left(-\mathrm{I}_{\mathrm{f}}\right)$
From the bus impedance matrix, $\mathrm{V}_{\mathrm{f}}$ should be
$\mathrm{V}_{\mathrm{f}}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{z}_{\mathrm{pi}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{ai}}-\mathrm{z}_{\mathrm{bi}}\right)\right) \mathrm{I}_{\mathrm{i}}+\mathrm{z}_{\mathrm{ff}}\left(-\mathrm{I}_{\mathrm{f}}\right)$
Note that $\mathrm{V}_{\mathrm{a}}$ and $\mathrm{V}_{\mathrm{b}}$ with $\mathrm{I}_{\mathrm{f}} \neq 0$ are
$\mathrm{V}_{\mathrm{a}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{ai}} \mathrm{I}_{\mathrm{i}}+\mathrm{z}_{\mathrm{fa}} \cdot\left(-\mathrm{I}_{\mathrm{f}}\right)$
$\mathrm{V}_{\mathrm{b}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{bi}} \mathrm{I}_{\mathrm{i}}+\mathrm{z}_{\mathrm{fb}} \cdot\left(-\mathrm{I}_{\mathrm{f}}\right)$
where $\mathrm{z}_{\mathrm{fa}}$ and $\mathrm{z}_{\mathrm{fb}}$ from (13) are
$\mathrm{z}_{\mathrm{fa}}=\mathrm{z}_{\mathrm{pa}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{aa}}-\mathrm{z}_{\mathrm{ba}}\right)$
and
$\mathrm{z}_{\mathrm{fb}}=\mathrm{z}_{\mathrm{pb}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{ab}}-\mathrm{z}_{\mathrm{bb}}\right)$
Eqs. (15) and (16) yield
$z_{f f}=z_{p p}+y_{s f}^{-1} y_{m}\left(z_{a p}-z_{b p}\right)+y_{s f}^{-1} y_{m}\left(z_{f a}-z_{f b}\right)+y_{s f}^{-1}$
or
$\mathrm{z}_{\mathrm{ff}}=\mathrm{z}_{\mathrm{fp}}+\mathrm{y}_{\mathrm{sf}}^{-1}\left(1+\mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{fa}}-\mathrm{z}_{\mathrm{fb}}\right)\right)$
Injecting current $-I_{f}$ to node $f$ and $I_{f}$ to node $q$ and adjusting until $\mathrm{V}_{\mathrm{f}}=\mathrm{V}_{\mathrm{q}}$, yields
$\mathrm{V}_{\mathrm{f}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{fi}} \mathrm{I}_{\mathrm{i}}+\mathrm{z}_{\mathrm{ff}}\left(-\mathrm{I}_{\mathrm{f}}\right)+\mathrm{z}_{\mathrm{fq}} \mathrm{I}_{\mathrm{f}}$
and
$\mathrm{V}_{\mathrm{q}}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{qi}} \mathrm{I}_{\mathrm{i}}+\mathrm{z}_{\mathrm{fq}}\left(-\mathrm{I}_{\mathrm{f}}\right)+\mathrm{z}_{\mathrm{qq}} \mathrm{I}_{\mathrm{f}}$
Equating $\mathrm{V}_{\mathrm{f}}$ to $\mathrm{V}_{\mathrm{q}}$ yields
$\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{z}_{\mathrm{fi}}-\mathrm{z}_{\mathrm{qi}}\right) \mathrm{I}_{\mathrm{i}}=\left(\mathrm{z}_{\mathrm{ff}}+\mathrm{z}_{\mathrm{qq}}-2 \mathrm{z}_{\mathrm{fq}}\right) \mathrm{I}_{\mathrm{f}}$
Note that
$\mathrm{z}_{\mathrm{fi}}-\mathrm{z}_{\mathrm{qi}}=\left(\mathrm{z}_{\mathrm{pi}}-\mathrm{z}_{\mathrm{qi}}\right)+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{ai}}-\mathrm{z}_{\mathrm{bi}}\right)$
and
$\mathrm{E}_{\mathrm{th}(\mathrm{k})}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z}_{\mathrm{ki}} \mathrm{I}_{\mathrm{i}}$
is Thevenin's voltage of node k (prior to connecting the new element). Using (26) and (27) yields
$\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{z}_{\mathrm{fi}}-\mathrm{z}_{\mathrm{qi}}\right) \mathrm{I}_{\mathrm{i}}=\mathrm{E}_{\mathrm{th}(\mathrm{pq})}+\frac{\mathrm{y}_{\mathrm{m}}}{\mathrm{y}_{\mathrm{sf}}} . \mathrm{E}_{\mathrm{th}(\mathrm{ab})}$
Note that $\mathrm{z}_{\mathrm{ff}}$ from (21) and $\mathrm{z}_{\mathrm{fa}}$ and $\mathrm{z}_{\mathrm{fb}}$ from (19) and (20) yield
$\mathrm{z}_{\mathrm{ff}}=\mathrm{z}_{\mathrm{pp}}+2 \frac{\mathrm{y}_{\mathrm{m}}}{\mathrm{y}_{\mathrm{sf}}}\left(\mathrm{z}_{\mathrm{ap}}-\mathrm{z}_{\mathrm{bp}}\right)+\left(\frac{\mathrm{y}_{\mathrm{m}}}{\mathrm{y}_{\mathrm{sf}}}\right)^{2}\left(\mathrm{z}_{\mathrm{aa}}+\mathrm{z}_{\mathrm{bb}}-2 z_{\mathrm{ab}}\right)+\frac{1}{\mathrm{y}_{\mathrm{sf}}}$
and $\mathrm{z}_{\mathrm{fq}}$ from (13) is
$\mathrm{z}_{\mathrm{fq}}=\mathrm{z}_{\mathrm{pq}}+\mathrm{y}_{\mathrm{sf}}^{-1} \mathrm{y}_{\mathrm{m}}\left(\mathrm{z}_{\mathrm{aq}}-\mathrm{z}_{\mathrm{bq}}\right)$
This yields

$$
\begin{align*}
\mathrm{z}_{\mathrm{ff}}+\mathrm{z}_{\mathrm{qq}}-2 z_{\mathrm{fq}}= & \frac{1}{\mathrm{y}_{\mathrm{sf}}}+2 \frac{\mathrm{y}_{\mathrm{m}}}{\mathrm{y}_{\mathrm{sf}}}\left(\left(\mathrm{z}_{\mathrm{ap}}-\mathrm{z}_{\mathrm{aq}}\right)-\left(\mathrm{z}_{\mathrm{bp}}-\mathrm{z}_{\mathrm{bq}}\right)\right)+\left(\mathrm{z}_{\mathrm{pp}}+\mathrm{z}_{\mathrm{qq}}-2 z_{\mathrm{pq}}\right) \\
& +\left(\frac{\mathrm{y}_{\mathrm{m}}}{\mathrm{y}_{\mathrm{sf}}}\right)^{2}\left(\mathrm{z}_{\mathrm{aa}}+\mathrm{z}_{\mathrm{bb}}-2 z_{\mathrm{ab}}\right) \tag{31}
\end{align*}
$$

Note that prior to connecting the new element,

$$
\begin{equation*}
\mathrm{z}_{\mathrm{th}(\mathrm{pq})}=\mathrm{z}_{\mathrm{pp}}+\mathrm{z}_{\mathrm{qq}}-2 \mathrm{z}_{\mathrm{pq}} \tag{32}
\end{equation*}
$$
