This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A novel multilevel optimization method applicable to problems modeled as bipartite networks. To the extent of our knowledge, the proposal is the first for bipartite network.
- The method has the capability of handling layers independently while executing the multilevel process.
- The implementation of the multilevel framework incorporates two novel efficient matching algorithms, as well as novel contracting and uncoarsening algorithms.
- Applications of the general-purpose method to solve two problems: community detection, in which the method is employed to scale a known algorithm, and dimensionality reduction, in which it is employed to define a novel algorithm.
- A comprehensive experimental evaluation of the proposed solution on real and synthetic bipartite networks that demonstrates it scales the original algorithm and preserves solution quality.
- A test case on dimensionality reduction in text classification, with promising results in terms of runtime and accuracy, is presented.
- A discussion on the underlying features of the framework and its applicability to solving various practical network problems are presented.
