6 **Abstract**

7 This paper proposes a multi-demand negotiation model that takes the effect of human  
8 users' psychological characteristics into consideration. Specifically, in our model each  
9 negotiating agent's preference over its demands can be changed, according to human  
10 users' attitudes to risk, patience and regret, during the course of a negotiation. And the  
11 change of preference structures is determined by fuzzy logic rules, which are elicited  
12 through our psychological experiments. The applicability of our model is illustrated  
13 by using our model to solve a problem of political negotiation between two countries.  
14 Moreover, we do lots of theoretical and empirical analyses to reveal some insights into  
15 our model. In addition, to compare our model with existing ones, we make a survey on  
16 fuzzy logic based negotiation, and discuss the similarities and differences between our  
17 negotiation model and various consensus models.

18 *Keywords:* automated negotiation, fuzzy logic, bargaining game, preference, agent

19 **1. Introduction**

20 A negotiation problem is a communication process among a number of agents about  
21 how to allocate profit, goods, resources and so on among them [1, 2, 3]. It is one of  
22 the most common phenomena in our daily life [4]. Therefore, since Nash built the  
23 first mathematical model of negotiation [5], various models have been proposed in  
24 various areas, such as economics [6, 7, 8, 9], political science [10, 11, 12], manage-  
25 ment science [13, 14, 15], sociology [16, 17, 18], and especially artificial intelligence  
26 [1, 19, 20, 21, 22, 23]. In the area of artificial intelligence, most of the studies about  
27 negotiation focus on handling one demand with one or multiple attributes in continuous  
28 domains. There are many examples of this kind, such as how to divide a pie [24], nego-  
29 tiation in an accommodation renting scenario [2], wage negotiation between employ-  
30 ers and employees [25], negotiation of multiple dependent issues based on hypergraph  
31 utility [26], using BLGAN strategy and its extension for dealing with consecutively-  
32 conceding opponents [27] or multifarious opponents [28] in one-shot negotiation, find-  
33 ing agents' optimal strategies in bilateral negotiation with uncertain information about
