This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A generative bayesian model is proposed for multi-view and multi-feature learning.
- The correlation across various views and features is jointly learned.
- The label information is embedded to obtain a more discriminant representation.
- The method is simplified to a class-conditional model for the optimization.
- Experimental results on five databases show the superiority of the method.
