This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose a multi-scale feature fusion network (MSFF) with structured sparsity for single image Super-resolution.
- The MSFF module can discover more possible structure and context information of the input image.
- Multiple MSFF modules are cascaded to improve the nonlinear representation ability of the network, and more accurate mapping relationships between the LR and HR images can be learned.
