Elucidation of lipid structural characteristics of chia oil emulsion gels by Raman spectroscopy and their relationship with technological properties

A.M. Herrero, C. Ruiz-Capillas, T. Pintado, P. Carmona, F. Jiménez-Colmenero

PII: S0268-005X(17)30204-7

DOI: 10.1016/j.foodhyd.2017.09.036

Reference: FOOHYD 4083

To appear in: *Food Hydrocolloids*

Received Date: 02 February 2017

Revised Date: 28 July 2017

Accepted Date: 20 September 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Several chia oil emulsion gels (EGs) developed with different plant ingredients
- Different composition of plant ingredients affects EG technological properties
- Differences in lipid structure due to EG composition determined by Raman spectroscopy
- Chia oil EG lipid structure was associated with specific textural behaviour
