This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A computational scheme for linear fractional order systems is put forward based on the Adams method and the Newmark $-\beta$ method to obtain the numerical solutions precisely and efficiently, no matter how the single degree of freedom (SDOF) and multi-degree-of-freedom (MDOF) system, or the system contains different type derivative operators at the same time.
- The enhanced response sensitivity approach in this paper does not depend on the selection of initial values.
- Measured data contain 10% noise and insensitive to the measurement noise.
- The weight matrix can indeed decrease the influence of the measurement noise and improve the accuracy of the identification procedure.
