This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Natural frequencies of pipes conveying gas-liquid two-phase slug flow are explored
- Natural frequencies perform periodic motion during the process of slug flow.
- ω_{RMS} increases first and then decreases with increase of u_{SG} for certain conditions.
- Divergent instability of the piping system is predicted.
