This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- We develop a model in which heterogeneous firms directly compete for workers
- Competition at the time of hiring endogenizes both average match output and wages
- This generates cohort effects: output and wages of new and existing matches differ
- The model can account for the dynamics of the aggregate labor share
- The labor share is countercyclical and overshoots after TFP shocks, as in the data
