This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

HIGHLIGHT

- We present a flow-sensitive (FS) centrality by integrating topological features and dynamical properties.
- We present an optimal mitigation strategy for cascading failures with power decentralization in a power grid.
- Community structure plays an important role in the cascading failure dynamics.
- The proposed measure is successful in enhancing the robustness of power grid networks.
