This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- This study highlights that although the majority of Chinese nulliparous women value vaginal delivery during pregnancy periods, high caesarean section rate still becomes a great concern in current China.
- This study reveals that individual preferences, birth attitude, and childbirth self-efficacy are altogether associated with women's different choices of mode of delivery.
- This study recommend that policy-makers, administrators and healthcare providers should continuously focus on how to decrease unnecessary caesarean sections. It is pivotal for obstetrical settings to provide early assessment and consultation regarding women's preferences for mode of delivery, to develop high-quality antenatal education system, and to establish a supportive social environment for shared decision-making.
