

## Accepted Manuscript

Title: First investigations for the characterization of glucosamine-6-phosphate synthase by capillary electrophoresis

Authors: Miriam Beneito-Cambra, Pierre Gareil, Bernard Badet, Marie-Ange Badet-Denisot, Nathalie Delaunay

PII: S1570-0232(17)31288-6  
DOI: <https://doi.org/10.1016/j.jchromb.2017.11.015>  
Reference: CHROMB 20912

To appear in: *Journal of Chromatography B*

Received date: 26-7-2017  
Revised date: 8-11-2017  
Accepted date: 10-11-2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

# First investigations for the characterization of glucosamine-6-phosphate synthase by capillary electrophoresis

## Highlights

- glucosamine-6-phosphate synthase exists as an active dimer or an inactive hexamer
- for the first time, the potential of CE to separate the two forms was demonstrated
- a short-end CE method led to an analysis time of about 1 min
- the effect of some incubation conditions and the inhibitor/enzyme ratio was studied
- 3 potential enzyme inhibitors were tested very rapidly and with very small amounts

## ABSTRACT

The enzyme glucosamine-6-phosphate synthase (GlmS) is an important point of metabolic control in biosynthesis of amino sugar-containing macromolecules and is therefore a potential target in order to design antibacterial and antifungal drugs. It has
