This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Isolation and characterisation of microcrystalline cellulose and cellulose nanocrystals from coffee husk and comparative study with rice husk

Highlights

- Purification of cellulose using alkali and bleaching treatments was effective.
- Notable microstructural changes at each stage of treatment are observed.
- Fibres and CNCs from rice and coffee husk have a high thermal stability.
- 1 wt% of cellulosic fibres or CNCs increased the elastic modulus of TPS films.
