This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The dynamic models have reliability to simulate a solar assisted liquid desiccant dehumidification system
- The maximum deviation between the humidity ratio results from simulation and measurements is 12.5 %.
- The comparison between the two employed dynamic models show that the disagreement between them is insignificant.
- The transient model could speed up the processing time by 21% more than the quasi-steady state mode
