This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Assesses heat tariff sustainability in DH system by statistic and dynamic methods.

Efficiency of DH system evaluated by Regression model and Data Envelopment Analysis.

A system dynamics model is developed to forecast the DH system indicators.

Applied policies accelerate transition to renewable energy and reduce CO₂ emissions.

Heat tariff reduction is presented by applying supporting mechanisms.
