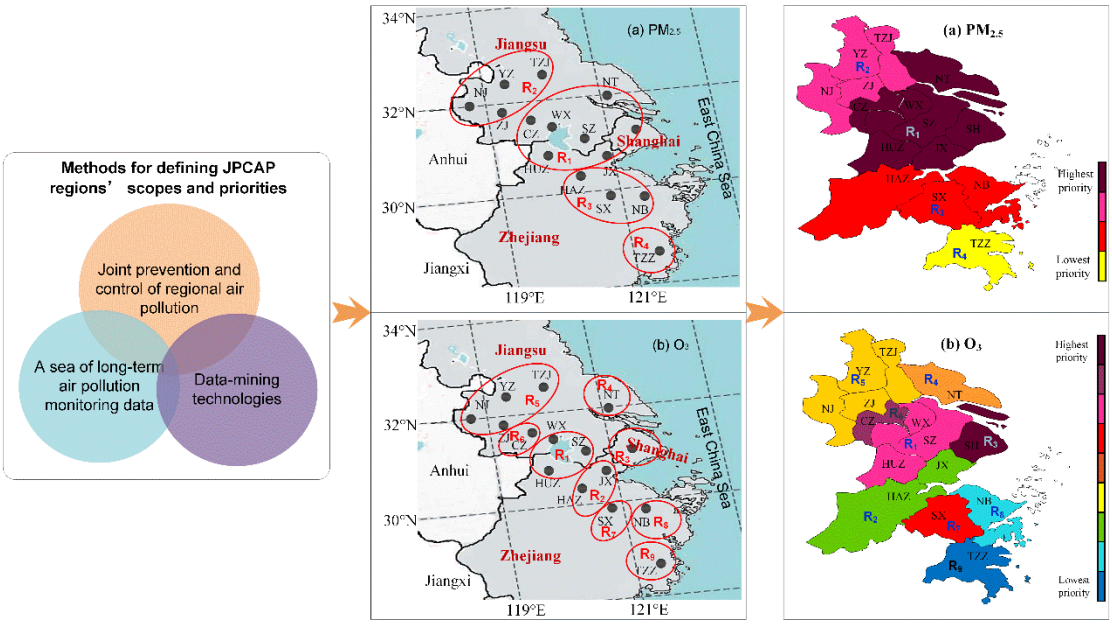
This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.



In order to improve the efficiency of joint prevention and control of regional air pollution (JPCAP), we, taking advantage of the big data of long-term pollution, proposed a new method for defining JPCAP scopes based on data-mining technologies and a new method for evaluating JPCAP regions' priorities based on the technique for order preference by similarity to an ideal solution (TOPSIS). And then we applied them to the case of Jointly Prevent and Control the pollutions of particulates smaller than 2.5 μm ($PM_{2.5}$) and ozone (O_3) in 15 cities of the Yangtze River Delta, China. Results showed that the 15 cities of the study region could be subdivided into four JPCAP sub-regions for $PM_{2.5}$, i.e. R_1={SZ, WX, CZ, JX, HUZ, SH, NT}, R_2={YZ, ZJ, TZJ, NJ}, R_3={HAZ, SX, NB}, and R_4={TZZ}, and nine for O_3, i.e. R_1={SZ, WX, HUZ}, R_2={HAZ, JX}, R_3={SH}, R_4={NT}, R_5={YZ, ZJ, TZJ, NJ}, R_6={CZ}, R_7={SX}, R_8={NB}, and R_9={TZZ}. The priorities order evaluated for the four sub-regions are $R_1>R_2>R_3>R_4$, and the nine sub-regions' order are $R_3>R_6>R_1>R_7>$ $R_4>R_5>R_2>R_8>R_9$. This perfectly match their actual conditions, suggesting that the new methods we developed are scientific and effective.
