This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Common Cancer-Driver Mutations and their Association with Abnormally Methylated Genes in Lung Adenocarcinoma from Never-Smokers

Short title: Genetic and epigenetic abnormalities in lung adenocarcinoma.

This article has supplemental data available online.

Highlights

- Lung adenocarcinoma in never smokers is a growing health concern in many countries.
- Some targetable cancer driver mutations like EGFR are more common in these tumors.
