This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A predator's response to a prey's deterrent signal changes with experience

Running Title: Role of experience in prey signal efficacy

Xalapa, Veracruz, México

## Highlights

- Naive jumping spiders reacted aversively to the tephritid fly's wing display.
- Experienced jumping spiders learned to overcome the fly display.
- The fly's appearance and display is an example of a multicomponent signal that deters jumping spider attacks.
